

A MuseWiki

Integration with external sites

Integration with external sites

amusewiki.org

uid Unique identifier (for multilanguage support)
cat Fixed category list (separated by space)
slides Boolean if slides are required (if the site sets that)
source String with the source notes
lang ISO code language (e.g. en)
pubdate Publication date

```
curl -F __auth_pass=XXXX \  
      -F __auth_user=tester \  
      -F textbody='Hello <em>hello</em>' \  
      https://sandbox.amusewiki.org/remote/create
```

Response:

```
{"error": "Missing mandatory title and textbody parameters"}
```

If you miss the the authentication parameters, you get a 401 response.

Parameters

Mandatory

__auth_user The username

__auth_pass The password

title The text title

textbody The HTML body

Optional

They are the very same parameters you can find in the `/action/text/new` form.

subtitle Text subtitle

author Text author

notes HTML string with the notes

teaser HTML string with the teaser

LISTtitle Text for indexing

SORTauthors List of authors, comma or semicolon separated list

SORTtopics List of topics, comma or semicolon separated list

date Date of the text

Contents

Embedding an existing text	5
Non-interactive creation of texts	5
Parameters	6

Embedding an existing text

Say the URL of the text you want to embed is `https://amusewiki.org/library/bookbuilder-tutorial`, you can add an `iframe` with `https://amusewiki.org/library/bookbuilder-tutorial/embed` to have the infobox with the downloads.

Example:

```
<iframe src="https://amusewiki.org/library/bookbuilder-tutorial/embed"
        width="700px"
        height="200px">
</iframe>
```

Non-interactive creation of texts

This procedure lacks any human interaction and it relies completely on the HTML conversion to be good enough. Worst case scenario, you are going to get a text which needs fixing.

You need an existing user on the site.

The API endpoint is `/remote/create`, e.g. `https://sandbox.amusewiki.org/remote`

You need to do a POST request with some mandatory and some optional parameters

Request:

```
$ curl -F __auth_pass=XXXXX \
      -F __auth_user=tester \
      -F title=prova \
      -F textbody='Hello <em>hello</em>' \
      https://sandbox.amusewiki.org/remote/create
```

Response is a JSON string, which holds the URL of the text which is going to be created and the job URL with the publishing.

```
{
  "url": "https://sandbox.amusewiki.org/library/prova",
  "job": "https://sandbox.amusewiki.org/tasks/status/17097"
}
```

If you are missing some mandatory parameters you get an error:
